Review

The indicator marks up charts in its own way. In contrast to the standard marking method, VR Grid marks chart with the specified step and links the grid to round price values. The VR Grid indicator keeps the mark up and scale, so that the grid cells always have a constant size.

Advantages

- It builds a custom grid on the chart.
- The grid is linked to circular levels.
- It is possible to set any step for the grid.
- You can set the color, style, and thickness for the entire grid or for specific levels.
- MetaTrader 4 and MetaTrader 5 versions of the indicator are exactly the same.
- It is easy to setup and install.
- It is suitable for both beginners and experienced traders.
- It works on any period and any time frame.

Operation algorithm

The indicator analyzes the current scale and price on the chart at every launch. It marks and builds a new grid according to the received data.

Readings accuracy

The indicator does not trade automatically, so the yield depends on the knowledge and skills of the trader.

Recommendations

Configure the grid as you like. Use round levels to find support and resistance.

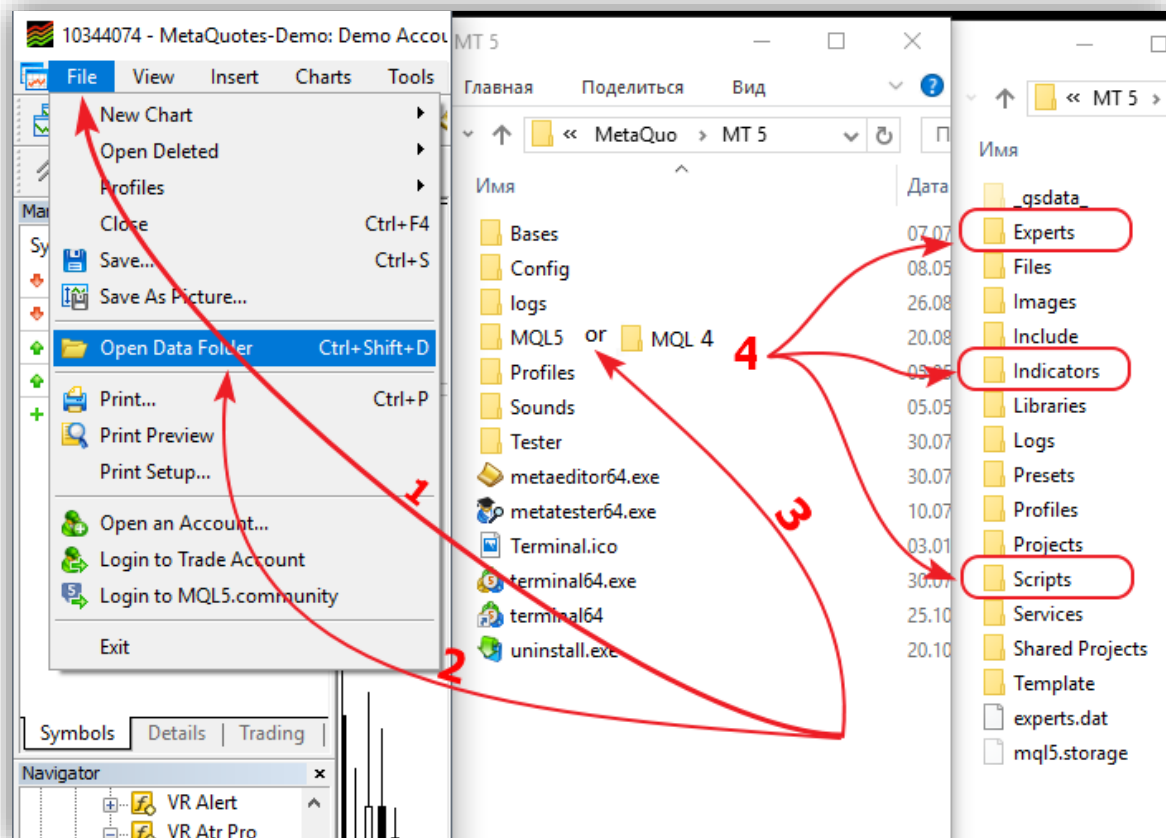

Settings

- Object in the background
- Horizontal line step
- Horizontal line color
- Horizontal line style
- Horizontal line Width
- Vertical line start
- Vertical line period step
- Vertical line color
- Vertical line style
